If you were in close contact with someone that has tested positive for COVID-19, you should quarantine and monitor for symptoms for 14 days. If you get tested during your 14-day quarantine period and you test negative, this does not mean your quarantine is over. It is still possible that you could develop disease after testing negative because the incubation period is 14 days. The 14-day quarantine should be completed even with a negative test during your quarantine. If you choose to get tested or your employer requires a negative test to return to work, the most effective time to get tested would be after your 14-day quarantine period is over.

A total of approximately 11,599 COVID-19 tests have been conducted in the North Shore as of 2:30 p.m. on July 23rd. With a population of approximately 65,000 in the North Shore, this indicates that 17.8% of the North Shore population has been tested at this time. Testing has decreased again after the Nicolet High School testing site closed, which is contributing to the high percent positive. However, our new cases per day continue to rise, leading to a high number of active cases in the North Shore. The % positive for the most recent days is subject to change as we continue to process negative lab results.
